

Learning normality, then rechecking local evidence

Layer-conditional fusion / Cross-layer trajectory prediction / Same-region perturbation recheck

(a) Bona fide training: representation and cross-layer relations

(b) Inference: localize once, align views, and recheck the same region

Training: $L = \text{Lrec} + \lambda \text{Ltraj}$, $\lambda = 0.1$

Current inference: $\rho = 0.30$, $\beta = 1.0$, $S = q_0 e / q_e$

sg: stop-gradient | T and Y: shared-LCF teacher and student groups | $e = m / [1 + d / (|m| + \epsilon)]$

Reported configurations: Dinomaly | + LCF | + LCF + CLTC | + LCF + CLTC + SPR
